About Hitit Seramik

Established on October 17, 1989 for the production of Ceramic Floor and Wall Tiles, Hitit Seramik Sanayi ve Ticaret A.Ş. started its activities on February 22, 1991 with a total capacity of 2 million m² including 1,000,000 m² Wall Tiles and 1,000,000 m² Floor Tiles in the first stage on 500,000 m² land located in Uşak Organized Industrial Zone. Hitit Seramik entered into a rapid growth process as a result of the new investment activities that were accelerated following the installation and production and the production capacity of 10 million m² was achieved in 76,000 m² closed factories complex within a short period of time.

Capacity and product type increase was required and so, a decision on new investments made in 2004 and works were started rapidly in the face of domestic and international markets' trust and intense demands of Hitit Seramik products, brand, and quality in the 2000s. 40,000 m² additional closed factory buildings were built and completed with the company's own resources in a short period of time and 20 million m² capacity was achieved by reaching to an additional production capacity of 10 million m².

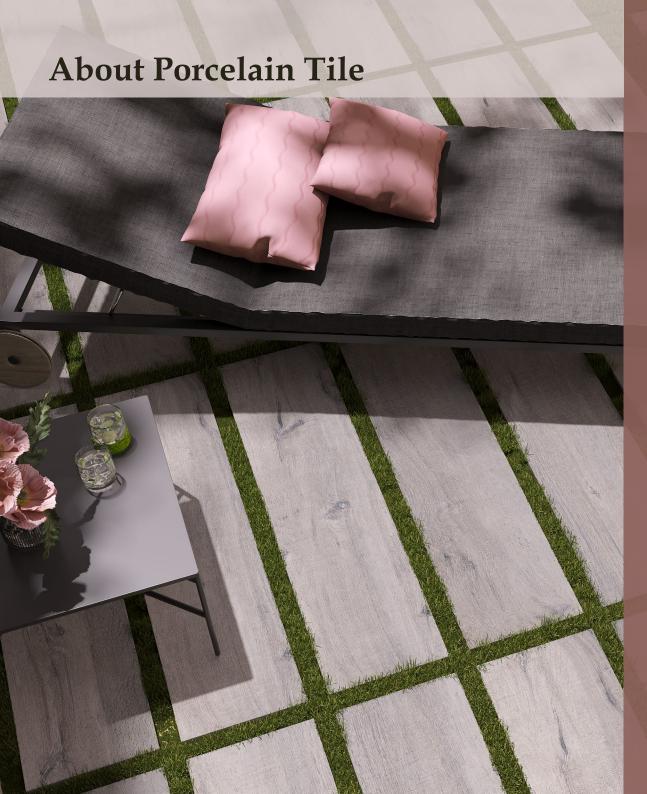

The history of *Hitit Seramik*

that always aims to produce and present the *cutting edge and bettermost*

• • •

It was aimed to present new and pioneering products that can be produced with special technologies and machines to Turkey and world markets by conducting extensive researches in investment studies and this has been achieved. Hitit Seramik has become one of the rare production facilities of the world that can produce the most sizes and types of coating materials in a production facility today with the power of its new investments.

These targets of Hitit Seramik, which always aims to produce the cutting edge and the bettermost, were achieved by identifying the needs of the user accurately, capturing innovative and creative approaches to respond to these constantly changing needs, creating a competitive structure within itself, conducting rigorous and forward-looking research in all investments, selecting the right technology and machinery, allocating large financial resources, and exhausting, but tasteful studies.

Product Description

Porcelain tile is a compact ceramic material with high density (2380-2450 kg/m³), low water absorption (< 0.5%) and small pore size ($<50 \,\mu m$) and low porosity (pore ratio in the structure).

Porcelain tiles are widely used in the construction industry, interior and exterior floor coverings, thanks to their excellent technical properties such as high breaking strength, high frost resistance, high abrasion resistance and high chemical resistance. The optimum firing temperature of porcelain tiles is between 1200-1250 C.

UN CPC code for Porcelain Tiles is 37310.

Product Area of Application

Porcelain tiles are used in terraces, gardens and public areas that are exposed to all external weather conditions with temperature difference due to their low water absorption coefficient. They should also be preferred for shopping malls and airports with heavy traffic conditions. All wet areas and general areas of use are suitable for porcelain tile flooring due to easy surface cleaning.

Raw Material	Composition, %
Kaolin	30-40
Clay	20-30
Feldspar	30-40
Others	0-5

LCA Information

> Goal and Scope

Evaluation of environmental impacts for 1 m² average porcelain tiles from cradle to grave.

> System Boundary

The system boundary of the Hitit Seramik Tiles are craddle to grave with module D.

Description of the system boundary $(X = Included in LCA, NR: Not Relevant)^*$

> Database and LCA Software Ecoinvent 3.8 and SimPro 9.3 is used for the calculation.

> Data Quality

Raw materials, energy and water consumption, waste generation, material and product transport data are primary data collected from Hitit Seramik.

> Period Under Review All primary data collected from Yurtbay is for the period year of 2021.

> Declared Unit 1 m² average tile with an average weight of 32 kg.

> Geographical Scope The geographical scope of this EPD is Türkiye.

^{*}Note: The LCA was modelled for specific product at plant so there is no variation.

^{*}Note: All primary data is taken from Hitit Seramik and Ecoinvent was used for secondary data.

System Boundary

A1-A3

Raw Material Supply, Transport & Manufacturing

A1 represents raw material supply which includes raw material extraction and pre-treatment processes before production.

A2 relevant to raw material transportation to the plant and A3 refers to the impact occurs from manufacturing process.

A4

Product Transport

This stage is relevant to the transportation of the final product from the factory gate to the customers.

A5

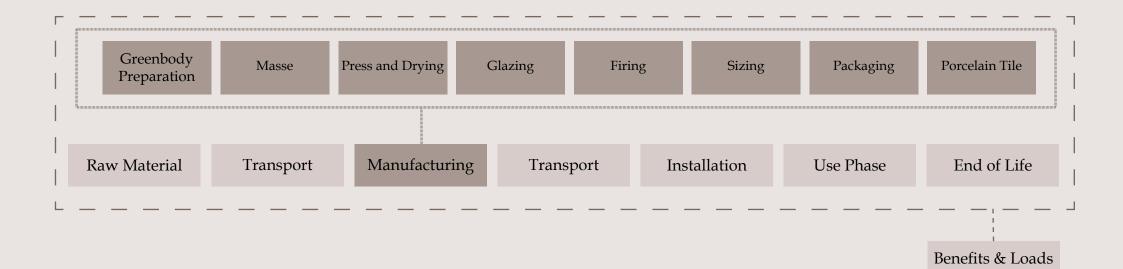

Installation

This stage includes the adhesive mortar and water usage in the construction site. For 1 m² tile installation; 6 kg mortar and 1.5L water usage was adviced by Hitit Seramik.

B1

Use

Tiles do not cause any emissions in the use stage because of their inert feature.

System Boundary

B2

Maintenance

Hitit Seramik advices to use 0.2 mL detergent and rinse with 0.1 L tap water after cleaning. The results are given for a one-time cleaning activity, as the activity will vary by user.

B3-B5

Repair, Replacement, Refurbishment

Tiles do not require any repairment during the use phase and therefore no impacts should be declared.

B6-7

Operational Energy Use and Operational Water Use

Tiles do not require any water and energy in the use phase and therefore no impacts ocurred in this module. **C**1

Deconstruction/Demolition

Deconstruction of tiles at the end of their life is done manually. So no impact occurs in this module.

C₂

Waste Transport

Waste transport includes diiscarded tiles and mortar to disposal area. Distance from demolition site to inert landfill site for final disposal is assumed as 50 km.

C3

Waste Processing

Environmental impacts generated during the crushing of discarded tiles before recycle or reuse are very low. Therefore, impacts are neglected.

C4

Disposal

Tiles end up at construction and demolition waste landfills at their end of life and modelled as such in this LCA.

D

Benefits & Loads

Inert filler benefits and recycling of packaging materials specified in the disposal stage.
